3. Project Design Phase

PROFESSIONAL PROJECT REPORT

3. Project Design Phase

Phase Objectives

- Design system architecture.
- Separate frontend, backend, business logic and data storage.
- Design user flow and modules.
- Prepare an expandable structure.

System Architecture

User → HTML/CSS/JavaScript → Python Flask → Budget Module / Recommendation Module → JSON or SQLite → Dashboard.

Main Modules

User Interface collects inputs. Budget Manager calculates income, expenses, balance and savings. Recommendation Engine filters affordable items. Data Layer stores information. API Layer connects frontend and backend.

Data Flow

The user enters income and expenses. Flask receives the data, calculates the financial summary, processes recommendation requests, and returns results to the dashboard.

Interface Design

Dashboard with income and expense inputs, summary cards, category selection, recommendation controls and result sections.

Expected Outcome

A complete technical design ready for implementation.
