

POCKETSMART AI

5. Project Development Phase

PROFESSIONAL PROJECT REPORT

5. Project Development Phase

Phase Objectives

- Implement frontend and backend.
- Develop budget calculation logic.
- Develop recommendation logic.
- Connect UI to Flask APIs.
- Maintain code using Git and GitHub.

Backend Development

Python Flask acts as the application server with routes for the dashboard, budget calculation and recommendations.

Budget Logic

Read income, read expenses, calculate total spending, subtract expenses from income, calculate savings rate when possible, and return structured results.

Recommendation Logic

Read category and available budget, compare product prices, filter matching categories and return affordable products.

Frontend Development

HTML provides structure, CSS provides responsive styling, and JavaScript communicates with Flask through API requests.

Version Control

Use Git to track changes and GitHub to store the repository.

Expected Outcome

A working PocketSmart AI application with integrated budget and recommendation functionality.

PocketSmart AI | Smart Budget & Recommendation Assistant
